

A Gentle Introduction to Agile and Lean Software Development

Agile development is a software development methodology that emphasizes iterative development, team collaboration, and customer feedback. Agile teams typically work in short sprints, which are time-boxed periods of development. At the end of each sprint, the team reviews its progress and makes adjustments to its plans. This iterative approach allows Agile teams to respond to change quickly and to deliver high-quality software on time.

Lean development is a software development methodology that emphasizes waste reduction and efficiency. Lean teams focus on identifying and eliminating waste from their processes. This can involve anything from reducing the number of defects in the code to streamlining the deployment process. Lean teams also emphasize continuous improvement, and they are always looking for ways to make their processes more efficient.

Agile and Lean are two complementary methodologies that can be used together to improve software development. Agile emphasizes iterative development and team collaboration, while Lean emphasizes waste reduction and efficiency. By combining the two methodologies, teams can achieve the benefits of both approaches.
